

Veracode Application Security Platform

DID YOU KNOW?

- ✓ Gartner has named Veracode a Leader in the Magic Quadrant for Application Security — for 3 years in a row.
- ✓ One Veracode customer reports having reduced its remediation costs by 75%, another reduced costs of finding vulnerabilities by 95% compared to its previous method.
- ✓ In 2015, Veracode helped fix 6,992,431 flaws out of 9,955,262 vulnerabilities — a 70% fix rate.

"I don't think that we would have been able to expand the program [that we had before Veracode] to the point that we have now, due to the added complexity of our legacy application estate. We would have needed to add 15 full time employees to the team."

Veracode Customer

Manage Your Entire Application Security Program in a Single Platform

Reduce the Cost of Application Portfolio Risk Management

Competing in business is all about speed of innovation. No matter what industry you're in, that innovation relies heavily on leveraging software. However, most applications were not created with security in mind, which is why applications are the most common breach vector. But looking at a giant backlog of insecure applications can be overwhelming. Training developers to write more secure code, testing applications and collaborating on remediation are challenging because application security expertise is very hard to find. Even worse, developers may not be cooperative if they believe that you only point out their mistakes and delay their projects.

The Veracode Application Security Platform provides a holistic, scalable way to manage security risk across your entire application portfolio. We offer a wide range of security testing and threat mitigation techniques, all hosted on a central platform, so you don't need to juggle multiple vendors or deploy tools. In addition, because application security cannot be solved with technology alone, our security program managers work with you to define policies and success criteria, so you'll have a strategic, repeatable way to tackle your application security risk. Finally, Veracode educates developers with actionable results, one-on-one coaching and a variety of training, so they can effectively fix existing flaws and code securely moving forward.

Manage all of your application risk on a single platform

Veracode can scan all of the applications and components you build or buy, covering all major languages, frameworks and application types. The Veracode Application Security Platform gives you a central repository for your applications and components, so you have full visibility into your risk posture. In addition, detailed reports and executive-level views help you to prioritize fixes, show reduced risk over time or compare progress across different teams. You also have the flexibility to leverage existing policies or create custom policies and then centrally view policy compliance.

Find vulnerabilities and detect and block attacks across development, testing and production

Veracode offers all major types of automated and manual risk assessments, so you won't have to juggle multiple vendors, reports and technologies. By integrating into each stage of your software development lifecycle, Veracode helps you build secure software, rather than making costly last-minute fixes that delay releases. We even help you detect and block exploitation attacks in production.

Use the industry's most mature native SaaS application security platform

With over 10 years of experience and \$100m in investment, the Veracode Platform is used by over 44,000 security professionals and software engineers to mitigate application security risk. Because the Platform has been cloud-based since its inception, it's constantly learning, so you benefit from solid results with a low false positive rate. These are just a few of the reasons why Veracode has been named a leader in the Gartner Magic Quadrant for Application Security Testing three years in a row.

Manage a program, not a tool

Many testing tools produce reports with lists of flaws and no actionable information in sight. In contrast, Veracode is dedicated to making sure that you actually fix the flaws you find. Our security program managers work with you to define policies and success criteria to set up a strategic, repeatable process. Veracode has assisted some of the world's largest and most complex companies overcome the hurdles preventing widespread adoption of application security best practices — so you know you're in good hands.

Enable your developers to code securely

Veracode offers a variety of developer enablement technologies and services to match anyone's learning style. Developers see which line of code their flaw is in and have easy access to short instructional videos to help them fix it. When developers get stuck, they can schedule a one-on-one coaching call with a Veracode application security consultant with a background in development. Veracode also offers application security training through on-demand eLearning courses and instructor-led trainings.

Scale your program more easily than on-premise programs

Scan one application or thousands; Veracode works with both the largest enterprises in the world and small development shops. Our cloud-based platform is ideal for fragmented business units and global teams of software engineers.
