

## Veracode Developer Training

### DID YOU KNOW?

- ✓ Development organizations that leverage eLearning see a 30% higher fix rate.

**Veracode State of Software Security Report, Volume 6**

- ✓ In a recent survey of developers, most respondents were aware of Cross-Site Scripting, but only 11% could correctly answer what helps to protect against it.

**Denim Group**

*"In the United States, there were 4 actively employed information security professionals for every 3 new jobs posted in 2014. Unless 3 of those 4 people are going to jump ship every year, we are in an unsustainable situation where we need to find and develop more talent."*

**Cory Scott,  
CISO at LinkedIn**

# Remediate 30% more vulnerabilities with developer training

## Reduce costs by training developers on application security

Developers have to learn new languages, frameworks and skills throughout their careers, yet most never have the chance to learn to code securely. In turn, many developers will unknowingly introduce security vulnerabilities in their code — and lack the knowledge to fix the issues when they are identified; indeed, even the top computer science programs do not require cybersecurity classes. This becomes even more critical as development practices like DevOps compress delivery schedules, putting pressure on the development team to solve its own problems without waiting on input from overtaxed security teams. Therefore, security issues are discovered later in the cycle, when they are more expensive to fix.

Veracode Developer Training empowers developers, testers and security leads to develop secure applications, providing the critical skills they need to identify and address potential vulnerabilities. Veracode offers three styles of teaching that reinforce each other. Instructor-led training offers real-time training that's tailored to your organization. On-demand training is integrated with the Veracode Application Security Platform and allows developers to learn when and where they need it. Veracode also offers short refresher videos and contextual recommendations to help developers fix vulnerabilities. Development organizations that leverage Veracode eLearning see a 30 percent higher vulnerability fix rate.

### Get application security training by developers, for developers

Veracode Developer Training covers topics such as secure architecture and design, secure coding techniques and remediation. The training is available in two forms: Veracode Instructor-Led Training (ILT) is delivered by the same application security consultants who provide remediation coaching to your development team, so they can provide relevant examples and tailor the conversation to your needs. Veracode eLearning provides a wealth of content offered on-demand, enabling developers to learn on their own schedule, and in real-time when fixing vulnerabilities. Veracode Developer Training builds on Veracode's real-world expertise from thousands of application security programs.

## Increase your remediation rate by 30% through developer training

As developers review the findings of their Veracode Static Analysis or Veracode Web Application Scanning, the Veracode Application Security Platform automatically recommends eLearning courses and offers quick video tutorials to show developers how to address common vulnerabilities. Veracode ILT allows development teams to dive deeper into difficult vulnerability types so they have all the context they need to address the specific issues that are critical to your program.

## Reach more developers through online delivery

Veracode ILT is delivered live via web conference so your entire security and development team can benefit. Because Veracode eLearning is delivered via the Veracode Platform, you can reach development teams no matter where on earth they reside. And our integrated SAML-based single sign-on automates developer provisioning so that you can go from a few developers to thousands without wasting time in an administrative console.

## Comply with PCI DSS, NIST and HIPAA

Veracode eLearning meets developer training needs for many common industry requirements, including PCI-DSS section 6.5, NIST 800-53 control AT-3 and HIPAA/HITRUST. Plus, developers can use their Veracode eLearning transcripts to earn continuing professional education (CPE) credit.

## Integrate developer training into your application security program

Veracode has over 10 years of experience helping developers and security teams create secure applications, so our program management team can help you develop a curriculum, define goals and optimize how your team is educated. And the Veracode Application Security Platform enables both developers and the security program, not only delivering training but also providing management reporting and curriculum and user administration through a single cloud-based interface.

**Contact Veracode to learn how Veracode Developer Training can help your development team code more securely, and see if you qualify for a free trial of Veracode eLearning**

## The Veracode Application Security Platform

*The Veracode Application Security Platform offers a holistic, scalable way to manage security risk across your entire application portfolio. We offer a wide range of security testing and threat mitigation techniques, all hosted on a central platform, so you don't need to juggle multiple vendors or deploy tools. Application security cannot be solved with technology alone, so our security program managers will work with you to define policies and success criteria and create a strategic, repeatable way to tackle your application security risk. Veracode educates developers with actionable results, one-on-one coaching, and a variety of training, so they can effectively fix existing flaws and code securely moving forward.*
