Veracode Container Security

VERACODE

Build & Deploy Securely

Coming Soon!

Find and fix container vulnerabilities with ease.

Veracode Container Security puts a powerful CI/CD pipeline security tool into the hands of developers. This helps teams perform scans early in the development process, ensuring containers are built and deployed securely.

Right at the CLI in your pipeline, developers can scan targets for comprehensive vulnerabilities and get actionable scan results that help them remediate effectively. With a few commands and code fixes, developers can confidently ship secure containers to production.

Developer First

Empower developers with an intuitive CLI tool that makes it easy, fast, and simple to secure various container targets, within your existing CI/CD process.

In-depth Coverage

Reduce risk by scanning for comprehensive flaws during development. Fix dangerous threats & misconfigurations before images are shipped to production.

Actionable Results

Remediate effectively with policy, contextual findings, and trusted open-source technology. Scan results immediately output in your CLI, helping you fix fast.

VERACODE

Build secure at the CLI

Access simple, easy-to-use CLI commands to quickly scan several targets including images, directories, repositories, and archives.

Seamless CI/CD integration

Make security a part of your everyday workflow with CI/CD integrations. Secure at multiple stages of your container build process.

Secure before shipment

Deploy securely by finding and fixing flaws as targets run through your pipeline. This prevents dangerous exploits before runtime.

Comprehensive coverage

Scan targets for known vulnerabilities, security misconfigurations (IaC files), and imbedded secrets.

SBOM & Policy Evaluation

Get results at the CLI in text, SBOM and JSON formats (CycloneDX, SWID, SPDX) and fix most critical flaws with policy evaluation.

Trusted open-source technology

Generate results you can trust with industry leading open-source developer projects Syft, Grype, and Trivy.

Gitlab® Busybox™ & Distroless™

Red Hat Enterprise Linux®

Ubuntu®

"I felt like this was **pretty easy** to get going. Getting the Veracode CLI setup was **simple**. My first scan on one of our production images was, once again, **super simple**. The commands in the CLI are **easily understandable**. The scan was **quick** and the different output options are nice."
