

Find vulnerabilities automation misses

Test the way you really want to. Flexible, frustration-free manual penetration testing

Penetration Testing as a Service (PTaaS) is a part of the Veracode Continuous Software Security Platform that unifies security and development teams to build software free of vulnerabilities and meet their compliance requirements. PTaaS easily identifies vulnerabilities only humans can find throughout the SDLC, with automatically scheduled tests and cost-effective pricing tiers.

Identify vulnerabilities only humans can find

Scanning tools are an important part of any holistic security program, but they have their limitations. They aren't curious and can't follow interesting leads that surface critical vulnerabilities.

Veracode's Penetration Testing as a Service allows organizations to find application and infrastructure vulnerabilities that scan engines can't find. It also allows customer to find those vulnerabilities more than once per year.

Penetration Testing, simplified

Manual Penetration Testing is critical to a well-rounded security program. Yet the procurement process is daunting at best. Finding a seasoned team, scoping and scheduling make performing more than one test per year difficult.

PTaaS converts Manual Pen Testing from an annual activity to a subscription service. No need to scope from scratch each time. The Veracode team can leverage previous tests and iterate.

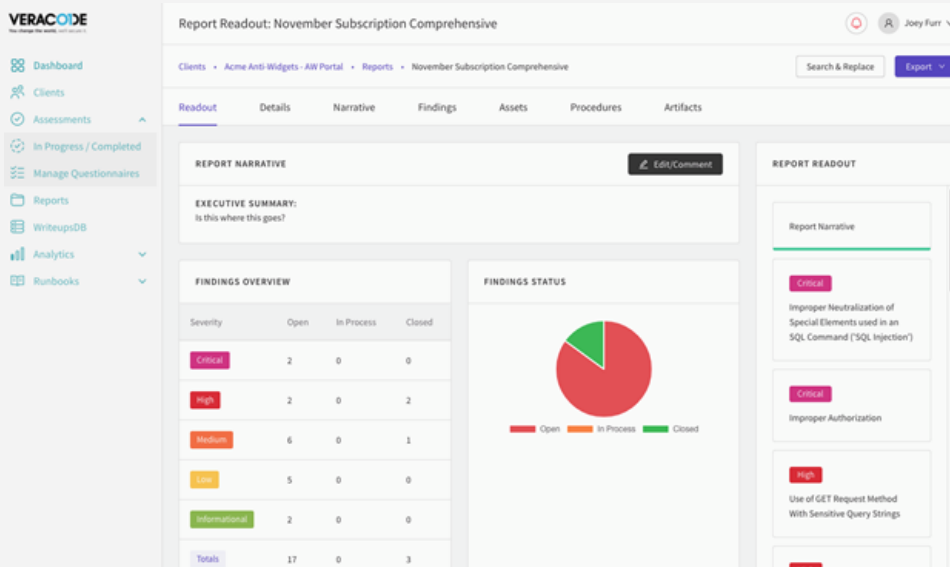

Protect the SDLC from beginning to end

From Static code testing to Manual Penetration Testing, it's important to cover the entire attack surface. Skipping steps or omitting tests can have negative consequences.

PTaaS allows organizations to cover an often-overlooked part of an end-to-end, multi-faceted security program that meets regulatory and policy requirements by allowing organizations to perform manual penetration tests on a regular cadence.

Everything in one place

Veracode Penetration Testing as a Service (PTaaS) test results can be found in a SaaS portal purpose-built for manual penetration testing.

The Portal tracks status, provides finding details, and shows proof of concept either step-by-step or through video exhibits.

Seasoned Security Experts

Good penetration testers are very hard to find. Excellent penetration testers are even harder to find.

At Veracode, our manual penetration testing team has hundreds of hours and more than three decades of collective testing experience. Our tests are object based and focus on identifying vulnerabilities that an attacker would.

Cost Effective, easy to include in the budget

Budgeting for an annual manual penetration test can be painful. Determining scope, attempting to time box the test to stay within budgetary constraints often means important applications and infrastructure go untested. PTaaS' tiered and packaged pricing make it easy to include regular manual pen testing in the security budget. There is no need to go through the procurement process each time.

Pre-scheduled and predictable

Remembering to schedule a manual penetration test and then working around schedules can be difficult.

PTaaS makes it easy to "set it and forget it". Manual Penetration tests are pre-scheduled on a quarterly interval so there is no need to account for lead time.
